Modern solutions for the orchard

SPECIFICATION

The method of attachment	Front right side, category 2
Max. PTO revolutions	540 rpm
Inclination of the cutting heads	-4 degrees / + 4 degrees
Number of working heads	2-4
Working height	3m-3,6m
Height and angle adjustment	Hydraulic actuators, electric control
Working speed	5 km/h
Weight	540 kg
Width adjustment	Manually by moving the screwed three-point linkage bracket
Distance between heads	490mm-690mm
Transport height	3m

Grunner GRIZZLY is a device that allows you to cut with eight horizontal sawscreate targeted thinning areas to encourage air and sunlight penetration throughout all parts of the tree canopy.
The machine is mounted at the front of the tractor, equipped with one or more cutting units and operated by an independent hydraulic unit with an 80-litre tank, a pump with a multiplier, an internal filter and a radiator for cooling. For cutting branches with a diameter of up to 1-7 cm, cutting discs are used, which can be easily and quickly replaced. In addition, each saw is equipped with additional spacer discs to protect the tree trunk from being cut off.

BENEFITS

Mechanical pruning with a Grunner GRIZZLLY saw significantly reduces the human factor in the process of cutting branches and radically reduces labor costs. Innovative pruning allows light to penetrate and air circulation between branches, reducing the need to use pesticides and other agents, and also facilitates the application of herbicides and fertilizers, allows for more convenient movement of machines in the orchard, and has a positive effect on the future productivity of plants and fruit color.

Performing cutting operations with a GRIZZLY saw in combination with the Grunner Raptor scythe reduces the human factor in the cutting process by up to 20%.
